

Urban Sustainability: Indicators, Patterns and Systems Dynamics

Artessa Saldivar-Sali & David Quinn
June 21, 2009

Overview

Sustainability Indicators

- Background
- Metrics

Pattern Identification

- Patterns in global road networks
- Patterns in cities

Integration of Metrics

Background

- Sustainable development paradigm is based on a comprehensive view of systems (Shields et al., 2002):
 - open
 - dynamic
 - Integrated
- Current practice of indicator selection is an *ad hoc* and piecemeal approach (Green and Champion, 1991)
- Reductionist approach cannot adequately analyze complex, multidisciplinary, global phenomena

Behavioral Characteristics of Complex Systems

- Counterintuitive
- Insensitive to parameter changes
- Policy-resistant
- Controllable through high-leverage points
- Long-run v. short-run response

Review of Indicator Frameworks

(after Olalla-Tarraga, 2006)

a. Issue-based

- i.e., energy consumption, employment, etc
- Does not match indicators with sustainability goals

b. Goal-based

- Indicators for each sustainability goal
- Does not capture complex interrelationships among various goals

c. Causal

- Driving forces-Pressures-State-Impacts-Response (DPSIR)
- tends to suggest linear cause-effect relations

d. Comparative

- Common indicators to compare trends across geographic areas
- Difficult to evaluate specific problems in particular locations

e. Ecosystemic

- Role of ecological aspects to provide material and functional basis for human activity
- Lack measures of livability, and focus only on metabolic flows

f. Combination

European Common Indicators

- Framework Type: Comparative
- 10 European Common Indicators
 1. Citizen satisfaction with the local community
 2. Local contribution to global climatic change
 3. Local mobility and passenger transportation
 4. Availability of local public open areas and services
 5. Quality of local ambient air
 6. Children's journeys to and from school
 7. Sustainable management of the local authority and local business
 8. Noise pollution
 9. Sustainable land use
 10. Products promoting sustainability

ICLEI Sustainability Indicators

- Combination: Issue-based, Goal-based
- Topic areas:

Air Quality

Biological Resources

Economy

Energy

Housing

Safety

Transportation

Water

Arts and Recreation

Civic and Political Involvement

Education

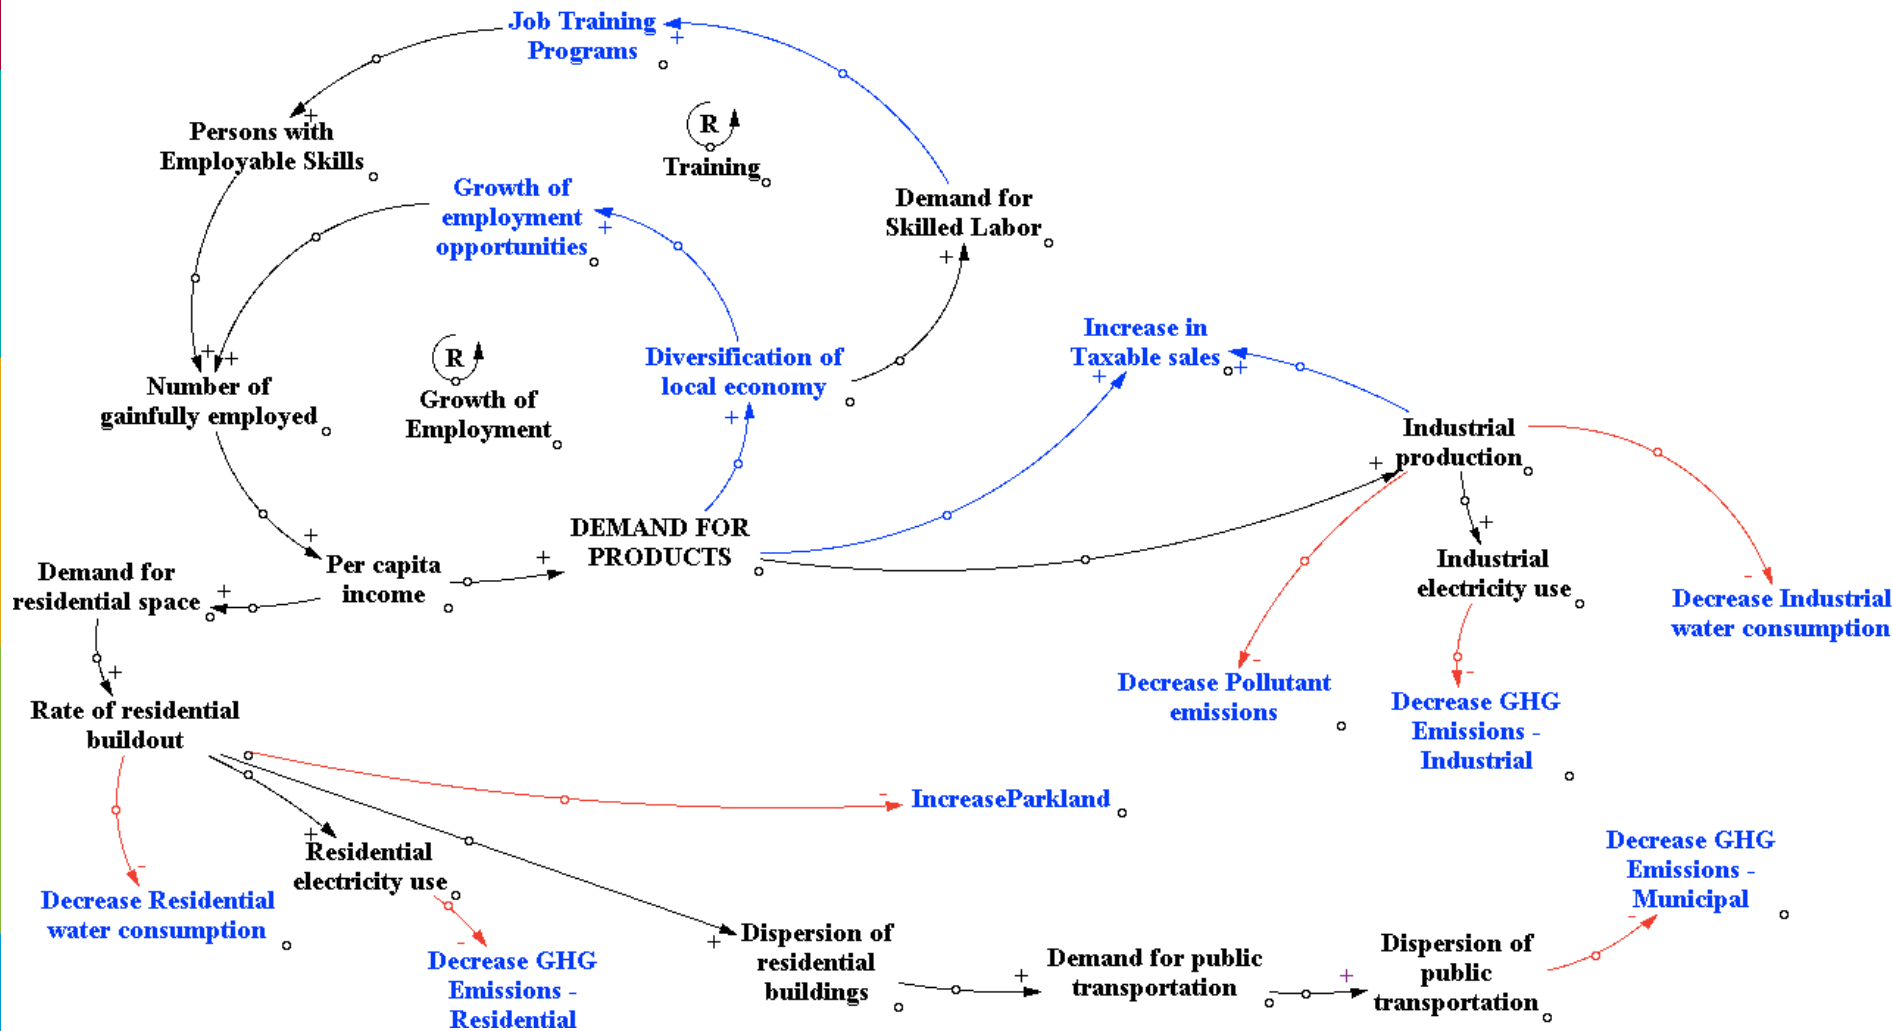

Health

Land

Sustainability Initiatives

Waste

ICLEI Indicator Relationships

Control Theory: gain of a feedback loop

- “Gain”
 - strength of the signal returned by the loop, e.g. a gain of 2 means a change in a variable is doubled each cycle
- Open loop gain
 - calculated for just one feedback cycle by breaking the loop at some point
 - partial derivative of x_1^O wrt x_1^I , i.e. the feedback effect of a small change in variable 1 as it returns to itself
 - $\delta x_1^O / \delta x_1^I = (\delta x_1^O / \delta x_n)(\delta x_n / \delta x_{n-1})(\delta x_{n-1} / \delta x_{n-2}) \dots (\delta x_2 / \delta x_1^I)$
- Furthermore, sign of each partial derivative is the polarity of each “arrow”

Patterns in Global Road Networks

Patterns in Global Road Networks

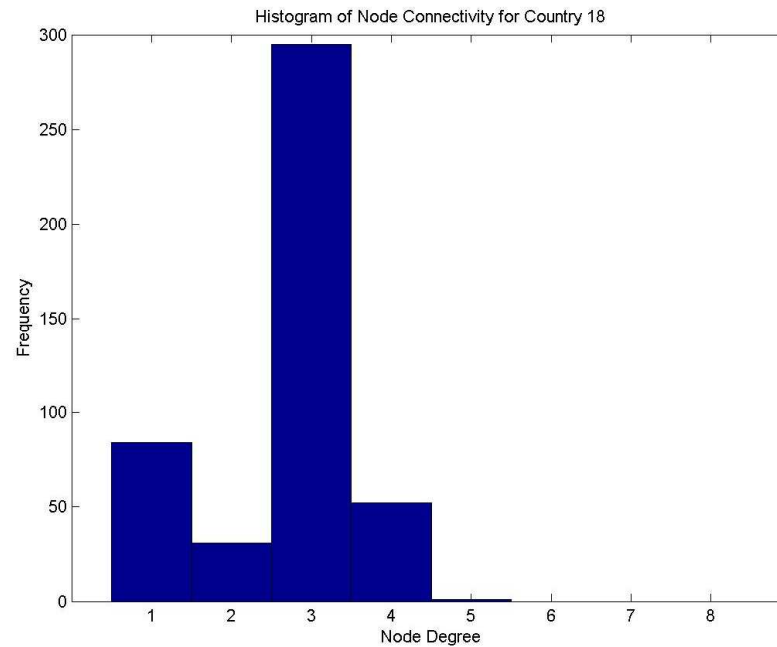

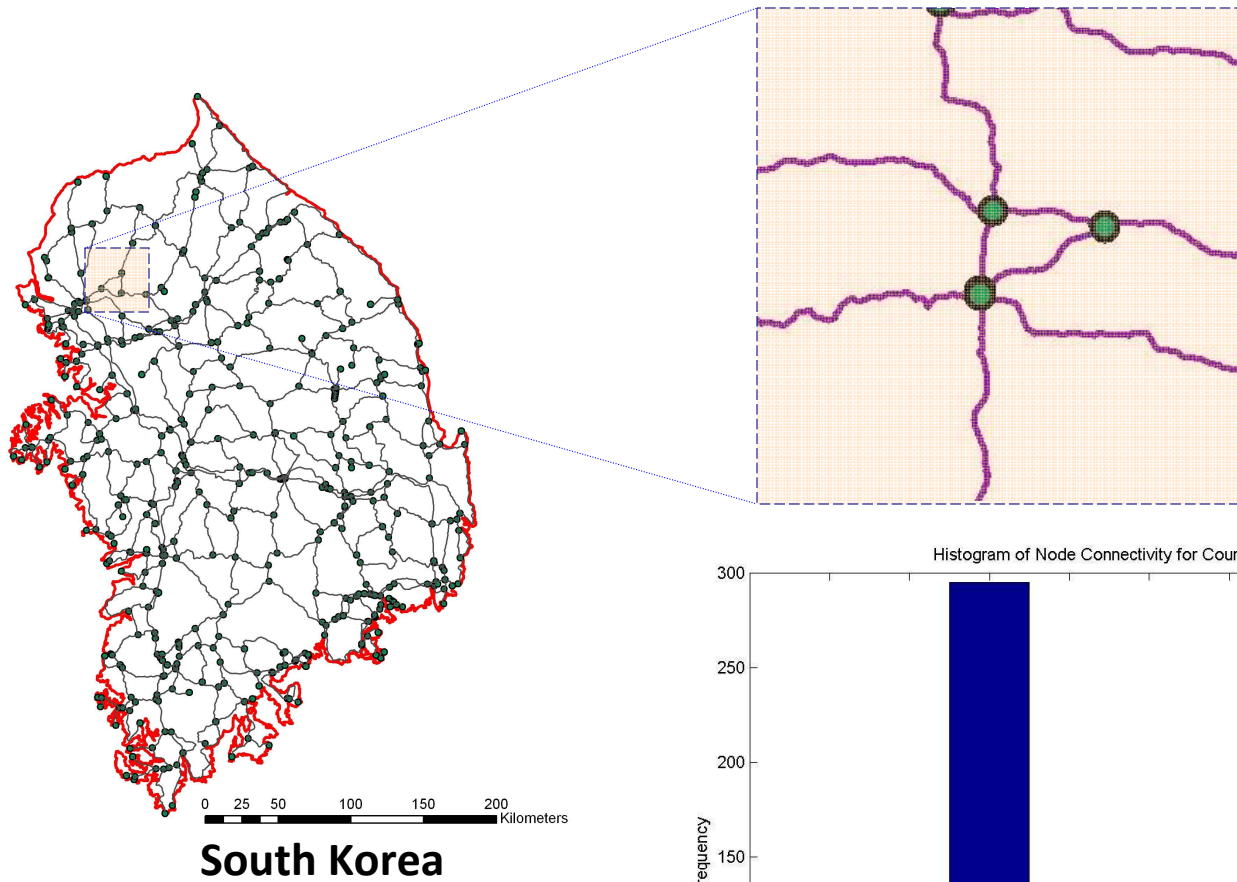

- Approach:
 - Road networks for 54 countries examined
 - Correlations between networks' properties with Gross Domestic Product (GPD), Human Development Index (HDI) and resource consumption

Patterns in Global Road Networks

Patterns in Global Road Networks

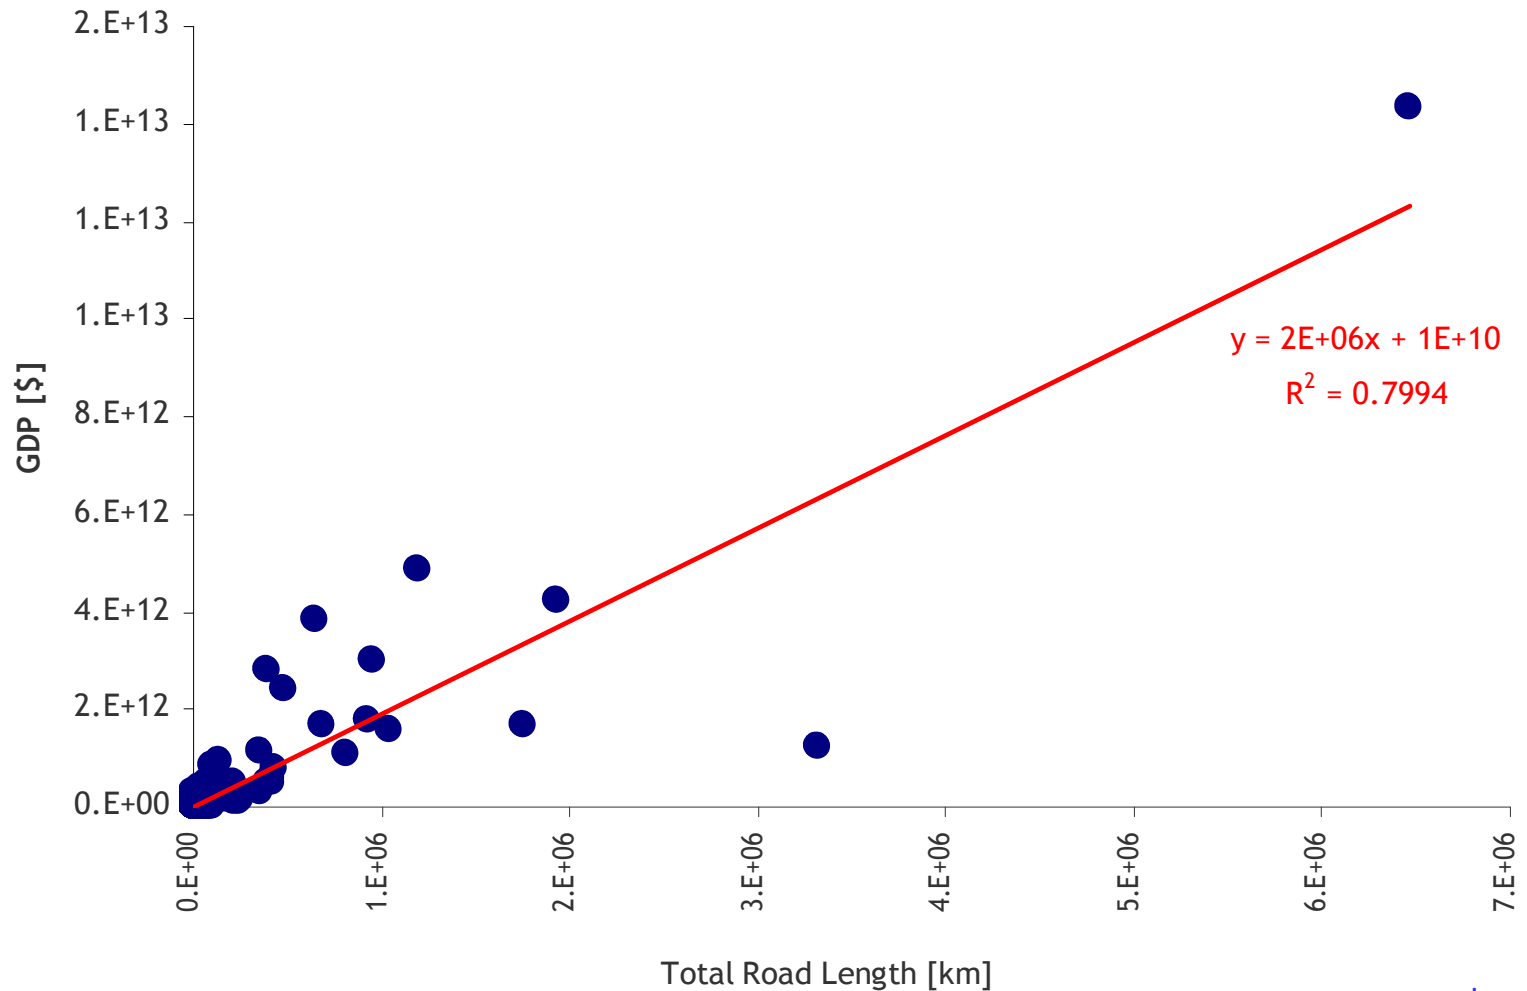

Patterns in Global Road Networks

The scatter plot illustrates the relationship between the average path length/area (links/km²) on the x-axis and the Human Development Index (HDI) on the y-axis. The x-axis ranges from 0.E+00 to 5.E-04, and the y-axis ranges from 0.00 to 1.00. Data points are color-coded by continent: Africa (blue), Asia (red), Europe (orange), North America (green), and South America (pink). A horizontal line at HDI ≈ 0.95 is labeled 'No increase in HDI'.

Continent	Avg Path/Area [links/km²]	HDI
Africa	0.000000	0.82
Africa	0.000001	0.55
Africa	0.000001	0.53
Africa	0.000002	0.38
Africa	0.000002	0.39
Africa	0.000003	0.70
Africa	0.000004	0.64
Asia	0.000001	0.73
Asia	0.000002	0.76
Asia	0.000003	0.78
Asia	0.000004	0.78
Asia	0.000005	0.53
Europe	0.000006	0.95
Europe	0.000007	0.95
Europe	0.000008	0.97
Europe	0.000009	0.93
Europe	0.000010	0.95

```

$$\sum (\text{Factor} * \text{Weighting}) =$$

Urban Sustainability Metric

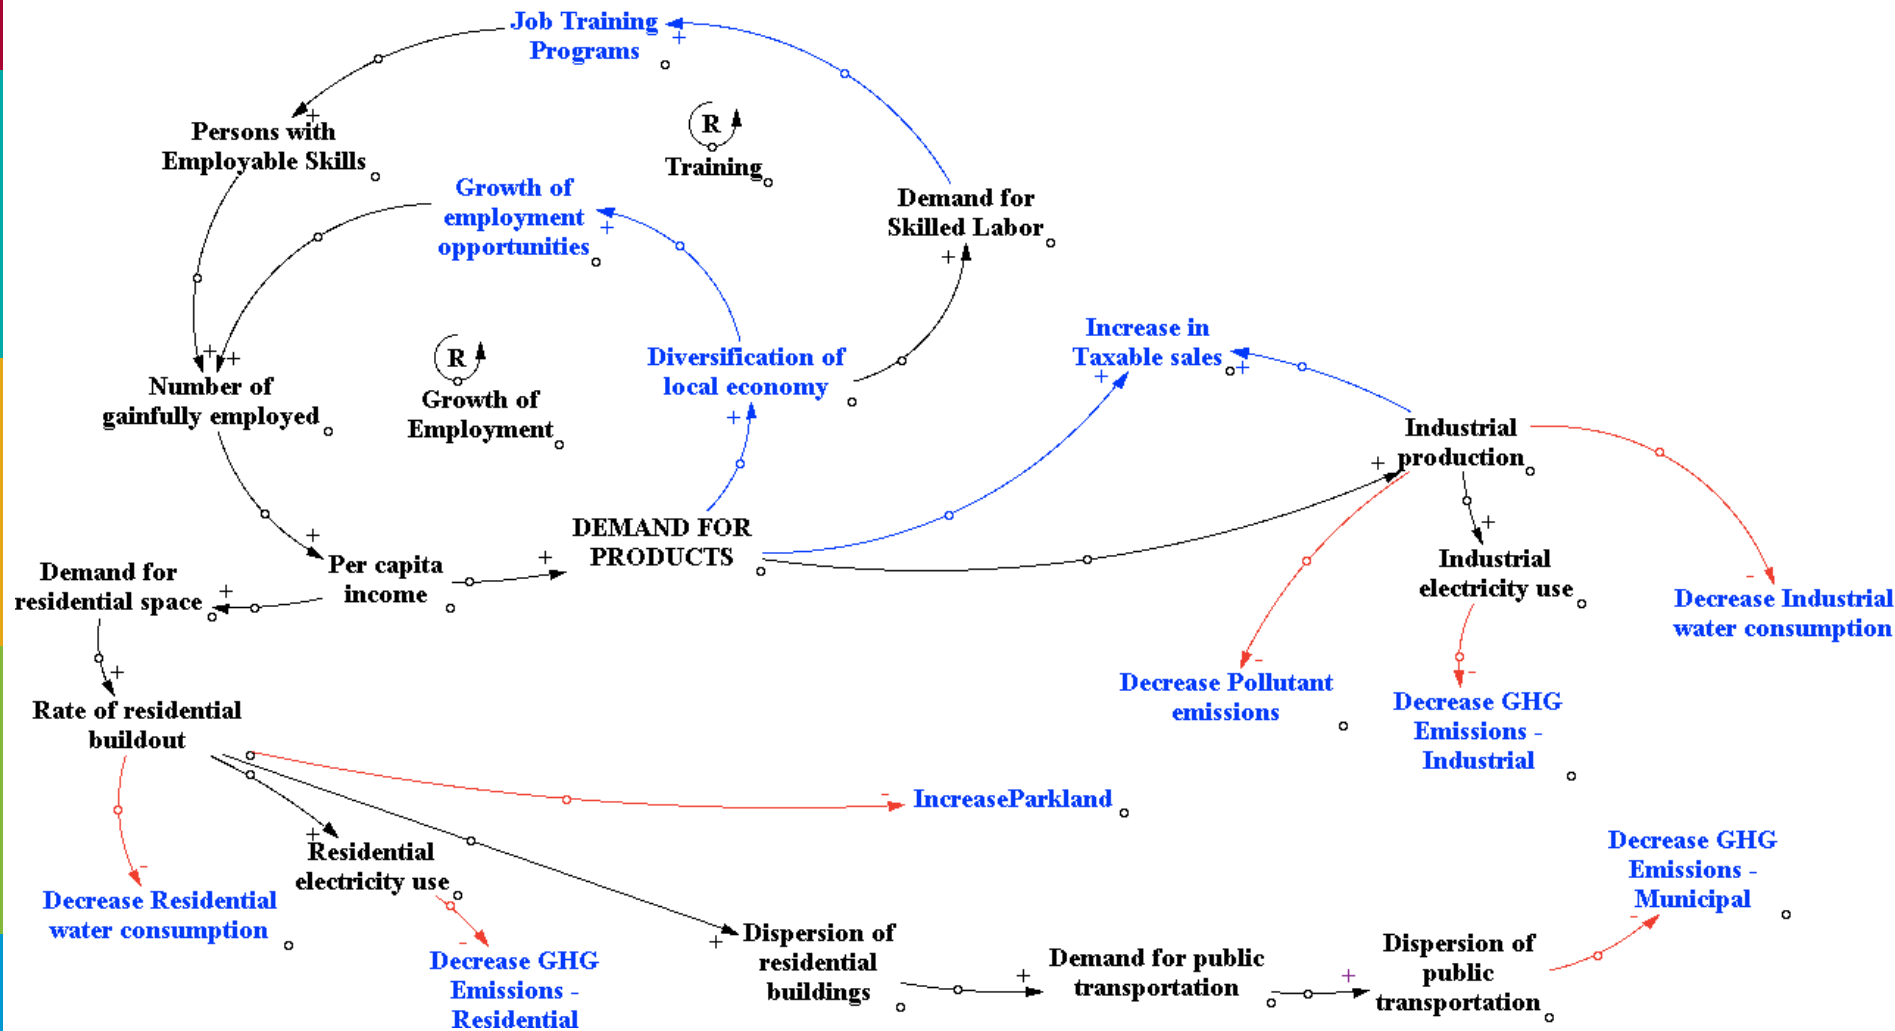

Identified using
indicator from SD
diagram

Scaling proportional
to signal strength of
feedback loop

System Dynamics model examines effect on examine the feedbacks effects of changing Indicator 1 on Indicator 2

ICLEI Indicator Relationships

Conclusions

Reductionist approach not appropriate for complex systems

Feedback analysis necessary to consider the effects of changes throughout the system

Patterns illustrate spatial variation in indicator of performance

Patterns and feedback loops result in a holistic approach
